October 15  
November 19  
December 17

### 2019 Recommended Immunizations for Children from Birth Through 6 Years Old

**NOTE:** If your child misses a shot, you don't need to start over. Just go back to your child's doctor for the next shot. Talk with your child's doctor if you have questions about vaccines.

**FOOTNOTES:**  
\* Two doses given at least four weeks apart are recommended for children ages 6 months through 6 years of age who are getting an influenza (flu) vaccine for the first time and for some other children in this age group.  
§ Two doses of HepA vaccine are needed for lasting protection. The first dose of HepA vaccine should be given between 12 months and 23 months of age. The second dose should be given 6 months after the last dose. HepA vaccination may be given to any child 12 months and older to protect against hepatitis A. Children and adolescents who did not receive the HepA vaccine and are at high risk should be vaccinated against hepatitis A.  
If your child has any medical conditions that put him at risk for infection or is traveling outside the United States, talk to your child's doctor about additional vaccines that he or she may need.
