

Crawford County-Moving Forward Reopening Dashboard

Active monitoring of real-time data-based metrics are critical. If metrics are not being met, mitigation strategies may be needed at the county level or even smaller scale (municipality, facility, or business). Each measure has a benchmark that we are striving for to be able to begin to reopen our county safely.

Thresholds for each metric are described as such:

	A red dot indicates that we have made limited progress towards meeting the benchmark.		A Yellow dot indicates we are making progress toward meeting the benchmark.		A green dot indicates we have met the benchmark.

Current Crawford County Reopening Dashboard

Last update: 6/1/2020

Next Phase Evaluation Date: 6/17/20

Benchmark	Why this is a Goal	Threshold Metrics	Current Status
Below a threshold of 5% for positive tests as a percent of total tests averaged across most recent 14-day period	Widespread testing improves our ability to identify as many cases as possible, minimizing the spread of COVID-19. If a high percentage of tests come back positive, it's clear there's not enough testing to capture all of the infected people in the community – testing is likely only being completed for the most severe cases or high-risk individuals.	<p>Green: Below 5% positivity</p> <p>Yellow: 5-10% positivity</p> <p>Red: Above 10% positivity</p>	 .7%
Below a low incidence threshold of 0.5 new cases per day averaged over most recent 14-day period	Incident threshold of new cases show how many cases we are seeing. High thresholds can represent wide disease spread, that is not being contained.	<p>Green: Below 0.5 cases per day</p> <p>Yellow: 0.5 to 2 cases per day</p> <p>Red: Greater than 2 cases per day</p>	 .2 new case average
Staffing supplies and staff facilitate adequate testing for disease control and surveillance with a goal of 34 tests per day for Crawford County (based 209 tests per 100,000 state goal) averaged over the most recent 14-day period	High testing level is critical metric that ensures our epidemiology criteria are meaningful. Testing is how we detect active infection which leads to contact tracing and prevents further spread. Testing also monitors the course of the epidemic.	<p>Green: Greater than 34 tests/day</p> <p>Yellow: 20-33 tests per day</p> <p>Red: Below 20 tests per day</p>	 Average 32 test/day

<p>Treat all patients without crisis care</p> <ul style="list-style-type: none"> - Facility is damaged or unsafe & non-patient areas are being used for care - Staff are unavailable or unable to adequately care for volume of patients - Critical supplies are lacking 	<p>Keeping the healthcare system stable is essential to ensuring care for COVID-19 and non-COVID19 patients.</p>	<p>Green: All health care facilities answer "no" to all 3 questions</p> <p>Yellow: One healthcare facility answers "yes" to one of the 3 questions</p> <p>Red: More than one facility answers "yes" to any of the questions and/or one facility answer "yes" to more than one of the questions</p>	
<p>Stable or decreasing numbers of infected health care workers</p>	<p>Health care workers, including non-medical staff who work in patient care settings, are at higher risk for exposure to COVID-19 and for spreading the virus to vulnerable community members due to the nature of the essential service they provide to the community.</p> <p>Ensuring that infections among health care workers are not increasing is important to ensure that the health care workforce is not depleted and is not unknowingly passing on the virus to other individuals in the health care setting.</p>	<p>Green: No significant increase in weekly healthcare worker infections in the most recent 14 days</p> <p>Yellow: One healthcare facility report 2 or more workers that are positive cases in the most recent 14 days</p> <p>Red: Two or more healthcare facilities report 2 or more workers that are positive cases in the most recent 14 days</p>	
<p>All positive cases can be reported and contacted quickly to facilitate rapid isolation and quarantine for disease control</p>	<p>Quickly identifying positive cases through reporting from labs and Public Health following-up with isolation instructions and notifying contacts who have been exposed helps to slow the spread of the virus in the community.</p>	<p>Green: More than 85% of all new cases are contacted within 48 hours of their test collection</p> <p>Yellow: 70-85% of all new cases are contacted within 48 hours of their test collection</p> <p>Red: Fewer than 70% of all new cases are contacted within 48 hours of their test collection</p>	 67%
<p>Proportion of contacted COVID- 19 cases who don't know where they could have gotten COVID- 19 in most recent 14-day period</p>	<p>The percent of cases with an unidentified exposure is how we gain a sense of the scale of undetected disease spread.</p>	<p>Green: Fewer than 20% of cases don't know where they could have gotten COVID-19</p> <p>Yellow: 20-30% cases don't know where they could have gotten COVID-19</p> <p>Red: More than 30% cases don't know where they could have gotten COVID-19</p>	 67%

Metrics will be re-evaluated in 14-day timeframes. If more than half of the metrics are green and epidemiology criteria are not red, the health department will advise the community to move to the next phase. If criteria is not met, we will stay in current phase until the next 14-day evaluation.
